Analysis Tasks

Mean Salary Calculation:

Mean = $\frac{\sum_i^n x_i}{n}$, n= number of data points, i= datapoint index

$$\begin{aligned}\therefore \text{Mean} &= \frac{60+75+65+50+80+45+95+85+70+55+78+82+90+40+95}{15} = \\ &= \frac{(110+140+150+100+160+130+190+85)}{15} = \frac{290+210+290+187+85}{15} = \frac{272+580+210}{15} = \frac{580+482}{15} = \\ &= \frac{1062}{15} = 70 + \frac{12}{15} = \mathbf{70.8}\end{aligned}$$

.....

Median Age Calculation:

1. Sort the datapoints:

- [22, 24, 25, 26, 28, 29, 30, 32, 33, 35, 36, 38, 39, 40, 41]

2. N= 15, so the middle index = 7th

$$\therefore \text{Median} = \mathbf{32}$$

.....

IQR for Projects Completed:

From step 1 at getting the median: [3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17]

IQR = min(3rd quarter) – max(1st quarter)

min(3rd quarter) = 13th value = 15 , max(1st quarter) = 3rd value= 5

$$\rightarrow \therefore \text{IQR} = 15 - 5 = \mathbf{10}$$

.....

Variance for Hours worked per week:

$$\begin{aligned}\text{Variance} &= \text{SS}/(n-1), \quad \text{SS: sum-of-squares} = \sum_i^n (x_i - \mu), n = 15, \\ \mu &= \text{mean}(\text{Hrs p week}) \\ &= \frac{(40 + 40) + (50 + 50) + 38 + 39 + (42 + 42 + 42) + 43 + 44 + 45 + 48 + (41 + 41)}{15} \\ &= \frac{(100 + 126) + (80 + 82) + (77 + 44 + 88 + 48)}{15} \\ &= \frac{226 + 162 + (77 * 2 + 11 + 92)}{15} = \frac{226 + 162 + 165 + 92}{15} = \frac{327 + 318}{15} = \frac{645}{15} \\ &= 43\end{aligned}$$

$$\begin{aligned}\text{SS} &= \\ &(40 - 43)^2 + (40 - 43)^2 + \\ &(42 - 43)^2 + (42 - 43)^2 + (42 - 43)^2 + \\ &(38 - 43)^2 + \\ &(45 - 43)^2 + \\ &(50 - 43)^2 + (50 - 43)^2 + \\ &(44 - 43)^2 + \\ &(39 - 43)^2 + \\ &(48 - 43)^2 + \\ &(41 - 43)^2 + (41 - 43)^2 + \\ &(43 - 43)^2 = 9 + 9 + 25 + 4 + 9 + 49 + 1 + 16 + 1 + 25 + 4 + 0 + 4 + 49 + 1 \\ &= 198\end{aligned}$$

$$\rightarrow \therefore \text{Variance} = 198/14 = 14 + (2/14)$$

Std Deviation for Hrs/week :

From the variance given:

$$\therefore \sigma = \sqrt{\text{variance}} = \sqrt{14.142857} = 3.761$$

.....

Z-Score for Performance Rating(for the one of 7-valued):

$$\text{z-score} = \frac{x - \mu}{\sigma}, \quad x = 7$$

$$\begin{aligned}\mu &= \frac{(8 * 3) + (9 * 4) + (7 * 2) + (6 * 2) + (5 + 4) + (2 * 10)}{15} \\ &= \frac{24 + 36 + 9 + 20 + 12 + 14}{15} = \frac{26 + 60 + 29}{15} = \frac{60 + 55}{15} = \frac{115}{15} \\ &= 7 + \frac{2}{3} = 7.667\end{aligned}$$

$$SS = (8 - 7.667)^2 * 3 +$$

$$(9 - 7.667)^2 * 4 +$$

$$(7 - 7.667)^2 * 2 +$$

$$(6 - 7.667)^2 * 2 +$$

$$(5 - 7.667)^2 + (4 - 7.667)^2 +$$

$$(10 - 7.667)^2 * 2 = 45.333$$

$$\sigma = \sqrt{45.333/14} = 1.799464$$

$$\rightarrow \therefore \quad \underline{\text{Z-score}} = \frac{7 - 7.667}{1.799464} = -0.3706659$$

Visualization Tasks:

The mean salary across employees

The distribution of ages across employees

HOURS WORKED VS. PERFORMANCE RATING
